FUND MANAGER'S COMMENTS

- The fund performance was 1.6% during the month, outperforming the benchmark by 1.4%. Key contributors were holdings in financials and government bonds while key detractors were energy and industrial sector.
- November was positive for global fixed income, after US Treasuries rallied following the Federal Reserve's dovish stance during November's FOMC meeting. Meeting minutes highlighted that the decision to keep rates unchanged was unanimous and that the committee agreed to proceed carefully amid rising uncertainties. Market expectations for US FFR has since shifted lower.
- US inflation continued to show signs of easing, with inflation data lower than the previous month, but still some distance from the Federal Reserve's 2% target. Latest round of economic data also disappointed leading to concerns over the US economy. As a result, the US Treasury 10-year yields rallied to 4.33% (-60bps) during the month.
- Asian credits saw similarly strong performance amidst talks of stimulus by the PBOC for the housing market and news of a whitelist of property developers eligible for a range of financing. However, data on property sales remain weak.
- Malaysia's fixed income market was also positive, as demand for local bonds improved following the rally in US Treasuries and after BNM held the OPR at 3.00% as widely expected during the month's MPC meeting.

STRATEGY:

- U.S. economy outlook continue to evolve with latest round of weaker economic data. Concerns over inflation subsided although still above Fed's 2% target. Nonetheless, expectation of a modest and slow decline in GDP growth has resulted in the Fed reiterating the 'higher for longer' narrative. With developed markets approaching peak cycle, risk appetite should return to EM.
- Domestically, moderating growth and subdued inflation continue to support the fixed income market, while widening interest differential and MYR weakness kept short-end rates elevated. Persistent demand from domestic investors continue to support the local market, though we are mindful of potential liquidity subsiding as we approach year end.
- With the hiking cycle expected to be towards the tail end, we look to gradually lengthen duration positioning, taking profit on shorter dated papers and re-investing in longer duration bonds. Continue to favour IG bonds, which could be more defensive as global growth slows.
- Smaller exposure to HY bonds as a slowdown in global growth could lead to more liquidity and credit rating downgrades. Close to zero exposure in China property sector as recovery expected to be slow despite policy support.
- Also positioning in selective government bonds across tenors. Maintain current high exposure to MYR bonds due to attractive yields.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Market risk	Market risk refers to the possibility that an investment will lose value because of a general decline in financial markets, due to economic, political and/or other factors, which will result in a decline in the target fund's NAV.
Liquidity risk	Liquidity risk refers to two scenarios. The first scenario is where an investment cannot be sold due to unavailability of a buyer for that investment. The second scenario exists where the investment, by its nature, is thinly traded. This will have the effect of causing the investment to be sold below its fair value which would adversely affect the NAV of the target fund.
Credit and default risk	Credit risk relates to the credit worthiness of the issuers of the bonds or money market instruments ("Investment") and their expected ability to make timely payment of interest and/or principal. Any adverse situations faced by the issuer may impact the value as well as liquidity of the Investment. In the case of rated investment, this may lead to a credit downgrade. Default risk relates to the risk of an issuer of the Investment either defaulting on payments or failing to make payments in a timely manner which will in turn adversely affect the value of the Investment. This could adversely affect the value of the target fund.
Interest rate risk	This risk refers to the impact of interest rate changes on the valuation of bonds or money market instruments ("Investment"). When interest rates rise, the investment prices generally decline and this may lower the market value of the Investment. The reverse may apply when interest rates fall.
Currency risk	<p>As the Investments of the target fund may be denominated in currencies other than the base currency, any fluctuation in the exchange rate between the base currency and the currencies in which the investments are denominated may have an impact on the value of these investments. Investors should note that any gains or losses arising from the fluctuation in the exchange rate may further increase or decrease the returns of the investment.</p> <p><u>Currency risk at the target fund level</u> The impact of the exchange rate movement between the base currency of the target fund and the currency of the underlying investments may result in a depreciation of the value of the investments as expressed in the base currency of the target fund.</p>

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Structured products risk

The NAV of the target fund will be impacted by the valuation of the structured product. Factors that may impact the valuation of the structured products will include, but not be limited to movement of the underlying assets, volatility of the underlying assets, interest rate levels, the correlation of the underlying assets and other such factors. Any change in the aforesaid factors would either positively or negatively impact the valuation of the structured products, hence impacting the NAV of the target fund. As such, the target fund's NAV will be exposed to potential price volatility, which will be dependent on the valuation of the structured products that the target fund invested in.

Country risk

Investments of the target fund in any country may be affected by changes in economic and political climate, restriction on currency repatriation or other developments in the law or regulations of the countries in which the target fund invests. For example, the deteriorating economic condition of such countries may adversely affect the value of the investments undertaken by the target fund in those affected countries. This in turn may cause the NAV of the target fund or prices of units to fall.

Regulatory risk

The investments of the target fund would be exposed to changes in the laws and regulations in the countries the target fund is invested in. These regulatory changes pose a risk to the target fund as it may materially impact the investments of the target fund. In an effort to manage and mitigate such risk, the fund manager seeks to continuously keep abreast of regulatory developments (for example, by closely monitoring announcements on regulators' website and mainstream media) in that country. The fund manager may dispose its investments in that particular country should the regulatory changes adversely impact the investors' interest or diminish returns to the target fund.
