April 2021

FUND MANAGER'S COMMENTS

The fund rose +1.33% in MYR terms for the month, underperforming the benchmark by -1bps. The outperformance of the month was driven by Materials, Financials and Consumer Staples.

FBMKLCI rose 28pts or 1.8% to 1,601.65pts in April. Gloves rallied on the back of the surge in COVID-19 cases domestically and abroad especially in India, while reopening plays took a hit. The Healthcare sector index was up 15%, followed by Industrial (+4) and Transport (+4%), while Energy and Finance were the worst performers, down 3% and 2% respectively. Malaysia's manufacturing PMI rose to a record of 53.9pts in April from 49.9pts in March, suggesting that the economy is steadily recovering from the pandemic. The last time the measure showed the economy was in expansion was in July 2020.

We stay Neutral on Malaysia and remain proponents of the reopening theme and thus constructive on sectors such as Financials, Cyclicals, Commodities and select Transport. As for tech, it has outperformed significantly, hence, we are very selective and focus on quality tech names while stay cautious on richly valued companies.

Asia: The MSCI AC Asia Pacific ex Japan Index gained 2.8% in USD terms last month. This was led by Taiwan and Australia while India lagged. Asian equities regained some ground after falling in the previous month. The US Federal Reserve remain steadfast in its assessment that any inflation pressure is likely to be transitory in nature. Hence, accommodative policies from policymakers are expected to prevail which lends support towards risky assets.

Accommodative policies will stay in place and fund flows are more likely to move to Asia given that (1) Asia is still under-owned, (2) earnings growth momentum is strong and (3) valuation is still attractive relative to global equities. The main risks that could derail the positive fundamental outlook are (1) earlier than expected tapering of CB balance sheet, (2) slower take-up of vaccines or any sharp surge in Covid cases leading to slower than expected economic recovery and (3) stronger than expected USD.

We rate Asian equities a BUY over a 12-month horizon. We expect a broadening out of economic recovery and have added more cyclical positions and re-opening exposure outside of China. The focus is also on quality companies which are long term winners, or benefit from structural changes in their respective industries.industries.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Stock specific risk	Prices of a particular stock may fluctuate in response to the circumstances affecting individual companies such as adverse financial performance, news of a possible merger or loss of key personnel of a company. Any adverse price movements of such stock will adversely affect the target fund's NAV.
Credit and default risk	The target fund will be exposed to a certain degree of credit and default risk of issuers or counterparties when the target fund invests in debt securities, money market instruments and/or place deposits. Credit risk relates to the creditworthiness of the securities issuers or counterparties and their expected ability to make timely payment of interest and/or principal. Any adverse situations faced by the issuers or counterparties may impact the value as well as liquidity of the investments. In the case of rated debt securities, this may lead to a credit downgrade. Default risk relates to the risk that a securities issuer or counterparty either defaulting on payments or failing to make payments in a timely manner which will in turn adversely affect the value of the investments. This could adversely affect the value of the target fund. We aim to mitigate this risk by performing bottom-up and top-down credit research and analysis to determine the creditworthiness of its issuers or counterparties, and impose investment limits on exposures for issuers or counterparties with different credit profiles as a precautionary step to limit any loss that may arise directly or indirectly as a result of a defaulted transaction.
Interest rate risk	Interest rate risk refers to the impact of interest rate changes on the valuation of debt instruments and money market instruments. When interest rates rise, debt instruments and money market instruments prices generally decline and this may lower the market value of the target fund's investment in debt instruments and money market instruments. In managing the debt instruments, we take into account the coupon rate and time to maturity of the debt instruments with an aim to mitigate the interest rate risk. As for money market instruments, the typical tenor of these instruments are less than 12-month maturity and unlike debt instrument, any change to interest rate will only have a minor impact to the prices of these instruments.
Country risk	Investments of the target fund in any country may be affected by changes in the economic and political climate, restriction on currency repatriation or other developments in the law or regulations of the countries in which the target fund invests in. For example, the deteriorating economic condition of such countries may adversely affect the value of the investments undertaken by the target fund in those affected countries. This in turn may cause the NAV of the target fund or price of units to fall.

RISKS

All investment carries some form of risks. The potential key risks include but are not limited to the following:

Currency risk	As the investments of the target fund may be denominated in currencies other than the base currency of the target fund, any fluctuation in the exchange rate between the base currency of the target fund and the currencies in which the investments are denominated may have an impact on the value of these investments. You should be aware that if the currencies in which the investments are denominated depreciate against the base currency of the target fund, this will have an adverse effect on the NAV of the target fund in the base currency of the target fund and vice versa. You should note that any gains or losses arising from the fluctuation in the exchange rate may further increase or decrease the returns of the investment.
Risk of investing in emerging markets	In comparison with investments in the developed markets, investment in emerging markets may involve a higher degree of risk due to the greater possibility of political or economic instability and societal tensions. Emerging markets are markets that are, by definition, "in a state of transition" and are therefore exposed to rapid political change and economic declines. The securities in the emerging markets may face a higher risk of price drop while the exchange rates in these emerging markets are generally more volatile than those of developed markets. As such, you should be aware that investments in emerging markets may subject to higher price volatility and therefore will tend to have a higher investment risk that will affect the target fund's growth. We attempt to mitigate these risks through active asset allocation management and diversification across different countries and sectors, in addition to our continuous bottom-up and top-down research and analysis.
Risks associated with investment in warrants	There are inherent risks associated with investment in warrants. The value of warrants is influenced by the current market price of the underlying security, the exercise price of the contract, the time to expiration of the contract and the estimate of the future volatility of the underlying security's price over the life of the contract. Generally, the erosion in value of warrants accelerates as it approaches its expiry date. Like securities, we will undertake fundamental research and analysis on these instruments with an aim to mitigate its risks.
